\textbf{C}^k \textit{Solvability near the characteristic set for a class of vector fields of infinite type}

W. A. Cerniauskas \hspace{1cm} A. Kirilov

\textbf{Abstract}

We consider vector fields of the form \( T_\lambda = (1 - r) \partial / \partial r + i \lambda \partial / \partial \theta \) defined on \( R_\delta = \{(r, \theta) : |r - 1| < \delta \} \), where \( \lambda \in \mathbb{C} \) and \( \text{Re}\lambda \neq 0 \). We look for \( C^k \) solutions of the equation \( T_\lambda u = f \) in a full neighborhood of the characteristic set \( \Sigma = \{r = 1\} \).

\section{Introduction}

Let

\[ T_\lambda = (1 - r) \frac{\partial}{\partial r} + i \lambda \frac{\partial}{\partial \theta} \]

be a complex vector field defined on \( R_\delta = \{(r, \theta) : |r - 1| < \delta \text{ and } \theta \in \mathbb{R}\} \), where \( (r, \theta) \) are the polar coordinates, \( \lambda \in \mathbb{C} \) and \( \text{Re}\lambda \neq 0 \).

Observe that the change of variables \( r' = r, \theta' = -\theta \) transforms \( T_\lambda \) into \( T_{-\lambda} \), therefore it suffices to study this operator in the case \( \text{Re}\lambda > 0 \).

The set \( \Sigma = \{r = 1\} \) is the characteristic set of \( T_\lambda \), that is, the region where \( T_\lambda \) fails to be elliptic.

This work deals with solvability of \( T_\lambda \) in following sense: for a fixed \( k \in \mathbb{Z}^+ \), we say that \( T_\lambda \) is \( C^k \) solvable at \( \Sigma \) if given \( f \in C^\infty(R_\delta) \) satisfying

\[ \int_0^{2\pi} f(1, \theta) \, d\theta = 0, \]

there is a \( C^k \) solution \( u \) of the equation

\[ T_\lambda u(r, \theta) = f(r, \theta) \]

\textit{Key words and phrases.} global solvability, solvability near the characteristic set, vector fields of infinite type, rotationally invariant complex vector fields.

The second author was partially supported by CAPES
in a neighborhood of $\Sigma$.

The vector field (1.1) is a model of a class of rotationally invariant complex vector fields of infinite type along a closed smooth curve. For further information on these concepts and ideas we refer the reader to the works [7, 11, 14, 16].

The equation (1.3) was studied by Berhanu and Meziani in the $C^0$ category, in [12], where the authors constructed continuous solutions near the characteristic set by analyzing two distinct cases, namely: $\lambda \in \mathbb{Q}^+$ and $\lambda \notin \mathbb{Q}^+$.

In [6], Bergamasco and Meziani proved that for every $\lambda$, there exist $C^\infty$ functions $f$ satisfying (1.2) such that equation (1.3) has no $C^\infty$ solution in any neighborhood of $\Sigma$.

A natural question then arises: are there $C^k$ solutions to this equation in a neighborhood of $\Sigma$?

In [16], Meziani proved that if $\lambda \notin \mathbb{Q}^+$ and $f \in C^\infty(R_\delta)$ satisfies (1.2) then, for every $k \in \mathbb{Z}^+$, the equation $T_\lambda u = f$ has a $C^k$ solution defined in a neighborhood of $\Sigma$.

The main goals of the present work are to give a new proof of the result about $C^k$ solvability of $T_\lambda$ obtained by Meziani, in [16], and also to present results about $C^k$-solvability of $T_\lambda$ when $\lambda \in \mathbb{Q}^+$. Our first result is the following.

**Theorem 1.1.** Let $f \in C^\infty(R_\delta)$ and $k \in \mathbb{N}$.

(i) If $\lambda \notin \mathbb{Q}^+$ and

$$
\int_0^{2\pi} f(1, \theta) \, d\theta = 0,
$$

then the equation $T_\lambda u = f$ has a $C^k$ solution $u$ in $R_\delta$;

(ii) If $\lambda = p/q \in \mathbb{Q}^+$ with $\text{gcd}(p, q) = 1$ and

$$
\int_0^{2\pi} \frac{\partial^l f}{\partial r^l} (1, \theta) e^{iql} \, d\theta = 0, \forall l \in \mathbb{Z}^+,
$$

then the equation $T_\lambda u = f$ has a $C^k$ solution $u$ in $R_\delta$. 
The strategy to prove this theorem is to use the same approach that was used by Berhanu and Meziani, in [12], introducing an essential modification in the way that the solution is constructed.

The study of existence and regularity of solutions near of the characteristic set is closely related to the study of global solvability and global hipoellipticity. In the articles [5, 6, 7, 14, 17] the authors study solvability near the characteristic set, while the articles [3, 4, 15, 16] study global problems in this approach. Other useful references are [1, 2, 8, 9, 10, 13] where the authors study vector fields and systems of vector fields on compact surfaces.

2 Preliminaries and a new formulation of the theorem

Since the operator $T_\lambda = (1-r)\partial/\partial r + i\lambda\partial/\partial \theta$ is elliptic outside of $\Sigma$, given $\delta, \varepsilon > 0$, such that $\varepsilon < \delta < 1$, it is possible to find $v_\varepsilon \in C^\infty(R_\delta)$ solution of $T_\lambda v_\varepsilon = f$, in $R_\delta \setminus R_\varepsilon$ and $v_\varepsilon \equiv 0$ in $R_{1/2}\varepsilon$. To obtain this solution we consider the structure of Riemann surface given by the operator $T_\lambda$, in each one of the connected components of $R_\delta \setminus R_\varepsilon$, and we use the Uniformization Theorem to construct a smooth change of variables in this component which transforms $T_\lambda$ in a multiple of the Cauchy-Riemann operator $\partial/\partial \overline{z}$. The solvability, in the $C^\infty$ sense, of $\partial/\partial \overline{z}$ provides a solution $v_\varepsilon \in C^\infty(R_\delta \setminus R_\varepsilon)$ of the equation $T_\lambda v_\varepsilon = f$ in $R_\delta \setminus R_\varepsilon$. Finally, by using a convenient cut-off function, we can assume $v_\varepsilon \in C^\infty(R_\delta)$ and $v_\varepsilon \equiv 0$ in $R_{1/4}\varepsilon$.

Therefore, after replacing $f$ by $f - T_\lambda v_\varepsilon$, we may assume that the right side of the equation $T_\lambda u = f$ is supported on $R_\varepsilon = \{(r, \theta) : |r-1| < \varepsilon\}$.

Thus from now on we will assume that

$$\text{supp} f \subset R_\varepsilon, \quad 0 < \varepsilon < \delta < 1/2.$$ 

We say that a function $f \in C^\infty(R_\delta)$ is flat at $r = 1$ if its partial derivatives of all orders vanish at $\Sigma$. 

In this work we will use the following result, which was obtained from lemma 4.2 of [12] by a change notation.

**Lemma 2.1.** Let \( f \in C^\infty(R_\delta) \).

(i) If \( \lambda \notin \mathbb{Q}^+ \), there is \( v \in C^\infty(R_\delta) \) with support in \( R_\varepsilon \) such that \( T_\lambda v - f \) is flat on \( r = 1 \) if and only if (1.4) holds;

(ii) If \( \lambda = p/q \in \mathbb{Q}^+ \) with \( \gcd(p, q) = 1 \), then there is \( v \in C^\infty(R_\delta) \) with support in \( R_\varepsilon \), such that \( T_\lambda v - f \) is flat on \( r = 1 \) if and only if (1.5) holds.

Thus, with the equivalent conditions presented in lemma 2.1, after replacing the original \( f \) by \( f - T_\lambda v_\varepsilon - T_\lambda v \), we may assume that the right side of the equation (1.3) is flat in \( r = 1 \) and \( \text{supp} f \subset R_\varepsilon \).

Therefore, in order to prove theorem 1.1, it is enough to prove the following result.

**Proposition 2.2.** If \( f \in C^\infty(R_\delta) \) is flat on \( r = 1 \) and \( \text{supp} f \subset R_\varepsilon \) then, given \( k \in \mathbb{Z}^+ \), there exists \( u \in C^k(R_\delta) \) such that \( T_\lambda u = f \).

We will prove this result providing Fourier coefficients of the solution and proving that these coefficients in fact correspond to a \( C^k \) function that satisfies the equation \( T_\lambda u = f \).

### 3 Construction of the \( C^k \) solution

To study equation (1.3), we use the characterization by Fourier series, relatively to \( \theta \), namely:

\[
f(r, \theta) = \sum_{n \in \mathbb{Z}} f_n(r)e^{in\theta}, \quad u(r, \theta) = \sum_{n \in \mathbb{Z}} u_n(r)e^{in\theta},
\]

where

\[
f_n(r) = \frac{1}{2\pi} \int_0^{2\pi} f(r, \theta)e^{-in\theta}d\theta
\]
and $u_n(r)$ is defined likewise.

Note that each $f_n(r)$ is supported in $[1 - \varepsilon, 1 + \varepsilon]$.

Equation (1.3) implies that each $u_n(r)$ satisfies the equation
\[
(1 - r)u_n'(r) - n\lambda u_n(r) = f_n(r), \quad \forall n \in \mathbb{Z},
\] (3.3)

Since we are assuming that $f$ is and flat on $r = 1$, we choose $u_n(1) = 0$, for every $n \in \mathbb{Z}$.

If $n < -k/\text{Re}\lambda$ we take
\[
u_n(r) = \frac{1}{(1 - r)^n\lambda} \int_0^r (1 - t)^{n\lambda - 1} f_n(t) \, dt, \quad \text{if } r < 1,
\] (3.4)
and
\[
u_n(r) = \frac{1}{(r - 1)^n\lambda} \int_r^\infty (t - 1)^{n\lambda - 1} f_n(t) \, dt, \quad \text{if } r > 1.
\] (3.5)

If $n \geq -k/\text{Re}\lambda$ and $n \neq 0$ we take
\[
u_n(r) = \frac{-1}{(1 - r)^n\lambda} \int_r^1 (1 - t)^{n\lambda - 1} f_n(t) \, dt, \quad \text{if } r < 1,
\] (3.6)
and
\[
u_n(r) = \frac{-1}{(r - 1)^n\lambda} \int_1^r (t - 1)^{n\lambda - 1} f_n(t) \, dt, \quad \text{if } r > 1.
\] (3.7)

Finally, for $n = 0$ we take
\[
u_0(r) = -\int_r^1 \frac{f_0(t)}{1 - t} \, dt, \quad \text{if } r < 1,
\] (3.8)
and
\[
u_0(r) = -\int_1^r \frac{f_0(t)}{t - 1} \, dt, \quad \text{if } r > 1.
\] (3.9)

**Remark 3.1.** The formulas (3.4), (3.5), (3.6) and (3.7) above are exactly the ones used by Berhanu and Mezziani in [11], page 139, however, there is an essential difference in the form that this expressions are chosen. For us, this choice takes into account the degree of regularity that is expected of the solution (we choose different formulas to $0 > n \geq -k/\text{Re}\lambda$).

In order to show that the function $u$, whose Fourier coefficients are defined above, is in fact a $C^k$ function, we present four lemmas which will help us to develop this proof.
Lemma 3.2. If \( f \in C^\infty(R_\delta) \) is flat on \( r = 1 \), \( \text{supp} f \subset R_\varepsilon \) and \( m, q \in \mathbb{Z}^+ \), then for all \( r \in (1 - \delta, 1 + \delta) \) and \( n \neq 0 \) we have
\[
\left| f^{(m)}_{n,p}(r) \right| \leq \frac{Q_{m+p,q}}{|n|^q},
\]
where the constant \( Q_{m+p,q} \) depends only on \( m + p \) and \( q \), and \( f^{(m)}_{n,p}(r) \) denotes the function defined by
\[
f^{(m)}_{n,p}(r) = \begin{cases} 
\frac{f^{(m)}(r)}{(r-1)^p}, & \text{if } r \neq 1 \\
0, & \text{if } r = 1
\end{cases}
\]
for all \( n \in \mathbb{Z} \) and \( p \in \mathbb{N} \).

Proof: If we differentiate \( m + p \) times the expression (3.2) and integrate by parts \( q \) times we obtain
\[
f^{(m+p)}_n(r) = \frac{1}{(in)^q} \frac{1}{2\pi} \int_0^{2\pi} \frac{\partial^q}{\partial \theta^q} \left[ \frac{\partial^{m+p}}{\partial r^{m+p}} f(r, \theta) \right] e^{-in\theta} d\theta.
\]
Furthermore \( f \in C^\infty(R_\delta) \) and \( \text{supp} f \subset R_\varepsilon \), hence
\[
\left| \frac{1}{2\pi} \int_0^{2\pi} \frac{\partial^q}{\partial \theta^q} \left[ \frac{\partial^{m+p}}{\partial r^{m+p}} f(r, \theta) \right] e^{-in\theta} d\theta \right| \leq Q_{m+p,q},
\]
therefore
\[
\left| f^{(m+p)}_n(r) \right| \leq \frac{Q_{m+p,q}}{|n|^q}.
\]
Since \( f_n \) is flat on \( r = 1 \), the Taylor’s formula for \( f^{(m)}_n \) gives
\[
f^{(m)}_n(r) = \sum_{s=1}^{p} \frac{f^{(m+s-1)}_n(1)}{(s-1)!} (r-1)^{s-1} 
+ \left[ \int_0^1 \frac{1}{(p-1)!} f^{(m+p)}_n(1 + t(r-1)) dt \right] (r-1)^p 
= (r-1)^p \int_0^1 \frac{1}{(p-1)!} f^{(m+p)}_n(1 + t(r-1)) dt,
\]
therefore
\[
f^{(m)}_{n,p}(r) = \frac{f^{(m)}_n(r)}{(r-1)^p} = \int_0^1 \frac{1}{(p-1)!} f^{(m+p)}_n(1 + t(r-1)) dt.
\]
Thus, from (3.12) follows that
\[
\left| f_{n,p}^{(m)}(r) \right| \leq \int_0^1 \frac{(1-t)^{p-1}}{(p-1)!} \left| f_{n+p}^{(m+p)}(1+t(r-1)) \right| \, dt \\
\leq \frac{Q_{m+p,q}}{n^q} \int_0^1 \frac{(1-t)^{p-1}}{(p-1)!} \, dt \leq \frac{Q_{m+p,q}}{n^q}
\]

This completes the proof.

Lemma 3.3. Assume that \( m, n, k \in \mathbb{Z}, \ n \neq 0 \) and \( 0 < m \leq k \). Then
\[
\prod_{j=0}^{m-1} \left| n\lambda + j \right| \leq c_m |n|^m
\]
where \( c_m \) is a positive constant that does not depend on \( n \).

Proof: Let \( j \in \mathbb{Z} \) such that \( 0 \leq j < m \),

i. if \( n < -k/\text{Re}\lambda \), then \( j(j + 2n\text{Re}\lambda) \leq 0 \) hence \( |n\lambda + j| \leq |n\lambda| \).

ii. if \( 0 > n \geq -k/\text{Re}\lambda \) and \( d_m = \max\{|\lambda + j/n|; 0 \leq j \leq m - 1\} \) then
\[
|n\lambda + j| = |n||\lambda + j/n| \leq d_m |n|
\]

iii. if \( n > 0 \) then \( |n\lambda + j| \leq |n\lambda + m| \leq |n||\lambda + m| \).

Therefore, we set \( c_m \doteq \max\{|\lambda|^m, d_m^m, |\lambda + m|^m\} \) and conclude the proof.

Lemma 3.4. If \( m \in \mathbb{Z}^+ \) is such that \( 0 \leq m \leq k \) and \( r \in (1-\delta, 1+\delta) \setminus \{1\} \), then,
\[
\left| \frac{d^m u_n}{dr^m}(r) \right| \leq c_m |n|^m \left[ \int_{1-\delta}^{1+\delta} |f_{n,k+1}(t)| \, dt + \sum_{j=0}^{m-1} \left| f_{n,k+1-j}^{(j)}(r) \right| \right]
\]

Proof: First, if \( n \neq 0 \) and \( r \in (1-\delta, 1+\delta) \setminus \{1\} \), by induction on the order of differentiation in (3.3) we can write
\[
\frac{d^m u_n}{dr^m}(r) = \prod_{j=0}^{m-1} \left| n\lambda + j \right| \frac{u_n(r)}{(1-r)^m} + g_m(r)
\]
where
\[ g_m(r) = \sum_{j=0}^{m-2} \left( \prod_{k=j}^{m-2} (n\lambda + k + 1) \frac{f_n^j(r)}{(1-r)^{m-j}} \right) + \frac{f_n^{m-1}(r)}{(1-r)} \]
and when \( n = 0 \) observe that \( u_n(r) \) satisfies (3.8) and (3.9), thus
\[ \left| \frac{d^m u_0}{d r^m} \right| = \left| \frac{d^{m-1}}{d r^{m-1}} \left( f_0(r) \right) \right| \]

We shall analyze each one of the four possibilities, given by the formulas (3.4), (3.5), (3.6) and (3.7), to insert \( u_n \) in the expression (3.13). For this we start by analyzing the expression \( \prod_j [(n\lambda + j)u_n(r)(1-r)^{-m}] \).

**Case 1:** \( n < -k/\text{Re}\lambda, r < 1 \) and \( m > 0 \);

By formula (3.4) and lemma 3.3 we obtain
\[ \left| \prod_{j=0}^{m-1} (n\lambda + j) \frac{u_n(r)}{(1-r)^m} \right| \leq c_m |n|^m |n\lambda + m| \int_0^r (1-t)^{n\lambda-1} f_n(t) \, dt \]
\[ = c_m |n|^m \left| \int_0^r \left( \frac{1-t}{1-r} \right)^{n\lambda+m} f_n(t) \, dt \right| \]
\[ \leq c_m |n|^m \left| \int_0^r \left( \frac{1-t}{1-r} \right)^{n\lambda+m} f_{n,m+1}(t) \, dt \right| \]
\[ = c_m |n|^m \int_0^r \left( \frac{1-t}{1-r} \right)^{m+n\text{Re}\lambda} \, dt. \]

Since \( 0 \leq t \leq r < 1 \) and \( m \leq k < -n\text{Re}\lambda \) hence \( 1-t \geq 1-r > 0 \) and \( m + n\text{Re}\lambda < 0 \), therefore
\[ \left( \frac{1-t}{1-r} \right)^{m+n\text{Re}\lambda} \leq 1. \]
Moreover, supp\( f_{n,m+1} \subset [1-\varepsilon, 1+\varepsilon] \) and for all \( t \in [1-\varepsilon, 1+\varepsilon] \) we have
\[ |f_{n,m+1}(t)| \leq |f_{n,k+1}(t)|, \]
Thus
\[ \left| \prod_{j=0}^{m-1} \left[ n\lambda + j \right] \frac{u_n(r)}{(1-r)^m} \right| \leq c_m |n|^m \int_{1-\varepsilon}^{1+\varepsilon} |f_{n,k+1}(t)| dt. \] (3.14)

**Case 2:** If \( n < -k/\text{Re}\lambda, r > 1 \) and \( m > 0; \)

By formula (3.5) and lemma 3.3,
\[ \left| \prod_{j=0}^{m-1} \left[ n\lambda + j \right] \frac{u_n(r)}{(1-r)^m} \right| \leq c_m |n|^m \int_{r}^{\infty} \left( \frac{t-1}{r-1} \right)^{m+n\lambda} \frac{f_n(t)}{(t-1)^{m+1}} dt \]
\[ = c_m |n|^m \int_{r}^{\infty} \left( \frac{t-1}{r-1} \right)^{m+n\lambda} f_{n,m+1}(t) dt. \]

Since \( 1 < r \leq t \) and \( m \leq k < -n\text{Re}\lambda \) hence \( t-1 \geq r-1 > 0 \) and \( m+n\lambda < 0, \)
thus
\[ \left( \frac{t-1}{r-1} \right)^{m+n\lambda} \leq 1, \]
Moreover, \( \text{supp} f_{n,m+1} \subset [1-\varepsilon, 1+\varepsilon] \) and for all \( t \in [1-\varepsilon, 1+\varepsilon] \) we have
\[ |f_{n,m+1}(t)| \leq |f_{n,k+1}(t)|, \]
thus
\[ \left| \prod_{j=0}^{m-1} \left[ n\lambda + j \right] \frac{u_n(r)}{(1-r)^m} \right| \leq c_m |n|^m \int_{1-\varepsilon}^{1+\varepsilon} |f_{n,k+1}(t)| dt. \] (3.15)

**Case 3:** If \( n \neq 0, n \geq -k/\text{Re}\lambda, r < 1 \) and \( m > 0; \)

By formula (3.6) and lemma 3.3,
\[ \left| \prod_{j=0}^{m-1} \left[ n\lambda + j \right] \frac{u_n(r)}{(1-r)^m} \right| \leq c_m |n|^m \int_{r}^{1} \left( \frac{1-t}{1-r} \right)^{k+n\lambda} \frac{f_n(t)}{(t-1)^{k+1}} dt \]
\[ = c_m |n|^m \int_{r}^{1} \left( \frac{1-t}{1-r} \right)^{na+k} |f_{n,k+1}(t)| dt. \]
Since $0 \leq r \leq t < 1$, then $1 - t \leq 1 - r$, moreover $k + n\text{Re}\lambda \geq 0$, hence

\[
\left(\frac{1 - t}{1 - r}\right)^{k + n\text{Re}\lambda} \leq 1.
\]

Thus

\[
\left| \prod_{j=0}^{m-1} \left[ n\lambda + j \right] \frac{u_n(r)}{(1 - r)^m} \right| \leq c_m |n|^m \int_{1+\varepsilon}^{1} |f_{n,k+1}(t)| \, dt. \tag{3.16}
\]

**Case 4:** If $n \neq 0$, $n \geq -k/\text{Re}\lambda$, $r > 1$ and $m > 0$.

By formula (3.7) and lemma 3.3,

\[
\left| \prod_{j=0}^{m-1} \left[ n\lambda + j \right] \frac{u_n(r)}{(1 - r)^m} \right| \leq c_m |n|^m \int_1^r \left( \frac{t - 1}{r - 1} \right)^{k + n\text{Re}\lambda} \frac{f_n(t)}{(t - 1)^{k+1}} \, dt \\
= c_m |n|^m \int_1^r \left( \frac{t - 1}{r - 1} \right)^{n\text{Re}\lambda + k} |f_{n,k+1}(t)| \, dt.
\]

Since $1 < t \leq r$ then $t - 1 \leq r - 1$, moreover $k + n\text{Re}\lambda \geq 0$, hence

\[
\left( \frac{t - 1}{r - 1} \right)^{k + n\text{Re}\lambda} \leq 1.
\]

Thus

\[
\left| \prod_{j=0}^{m-1} \left[ n\lambda + j \right] \frac{u_n(r)}{(1 - r)^m} \right| \leq c_m |n|^m \int_{1+\varepsilon}^{1} |f_{n,k+1}(t)| \, dt. \tag{3.17}
\]

Note that, in the above four cases, we have the same estimate for the term containing the product sign.

Now, to estimate the term $g_m(r)$ that appears in the expression (3.13),
when \( m > 0 \), we have

\[
|g_m(r)| = \left| \sum_{j=0}^{m-2} \left( \prod_{l=j}^{m-2} \frac{n\lambda + l + 1}{(1-r)^{m-j}} \right) f_n^{(j)}(r) \right| + \left| f_n^{(m-1)}(r) \right| \\
\leq c_m |n|^m \sum_{j=0}^{m-2} \left| \frac{f_n^{(j)}(r)}{(1-r)^{m-j}} \right| + \left| f_n^{(m-1)}(r) \right| \\
\leq c_m |n|^m \sum_{j=0}^{m-2} \left| \frac{f_n^{(j)}(r)}{(1-r)^{k+1-j}} \right| + \left| f_n^{(m-1)}(r) \right| \\
\leq c_m |n|^m \sum_{j=0}^{m-1} \left| f_n^{(j)}(r_{n,k+1-j}) \right| .
\]

Finally, when \( m = 0 \), note that in all cases above the inequalities hold if we set \( g_0 \equiv 0 \) and \( c_0 = 1 \), which concludes the proof.

\[ \square \]

**Lemma 3.5.** If \( m, n \in \mathbb{Z} \) and \( 0 \leq m \leq k \), then

\[
\lim_{r \to 1^-} u_n^{(m)}(r) = 0. \quad (3.18)
\]

**Proof:** First, if \( n < -k/\text{Re}\lambda \), we choose a number \( \alpha \) \((0 < \alpha < 1)\) such that \((n\text{Re}\lambda + k + \alpha) < 0\). When \( r < 1 \), it follows from the formula (3.4) that

\[
\lim_{r \to 1^-} \left| \frac{u_n(r)}{(1-r)^k} \right| = \lim_{r \to 1^-} \left| (1-r)^\alpha \int_0^r \frac{(1-t)^{n\lambda+k+\alpha}}{(1-t)^{1+k+\alpha}} f_n(t) \, dt \right| \\
\leq \lim_{r \to 1^-} (1-r)^\alpha \int_0^r \left| \frac{(1-t)^{n\text{Re}\lambda+k+\alpha}}{(1-t)^{1+k+\alpha}} \right| f_n(t) \, dt \\
= \lim_{r \to 1^-} (1-r)^\alpha \int_0^r f_{n,k+2}(t) \, dt = \lim_{r \to 1^-} (1-r)^\alpha r R_n = 0,
\]

where the constant \( R_n \) is given by the mean value theorem for integrals.

When \( r > 1 \) we use the formula (3.5) and recall that the support of \( f_n \) is
Proof of the proposition 2.2: Since, for every $0 \leq m \leq k$, $u_n^{(m)}(r)$ is continuous in $(1-\delta,1+\delta) \setminus \{1\}$ and $\lim_{r\to1} u_n^{(m)}(r) = 0$, hence if we set $u_n^{(m)}(1) = 0$, then $u_n^{(m)}(r)$ will be continuous in $(1-\delta,1+\delta)$, for all $n \in \mathbb{Z}$. 

Now we are able to prove that the solution $u$ given by the expressions (3.4) – (3.9) is, in fact, a $C^k$ solution to the equation $T - \lambda u = f$. 

\[\lim_{r\to1^+} \left| \frac{u_n(r)}{(1-r)^k} \right| = \lim_{r\to1^+} \left| \frac{u_n(r)}{(1-r)^k} \right| \leq \lim_{r\to1^+} \int_{t=1}^{r} \left| \frac{u_n(r)}{(1-r)^k} \right| \leq \lim_{r\to1^+} \int_{t=1}^{r} \left| \frac{u_n(r)}{(1-r)^k} \right| dt \leq \lim_{r\to1^+} R_n(r-1) = 0 \] 

Therefore we can conclude that $\lim_{r\to1} u_n(r)(1-r)^{-k} = 0$, for all $n \neq 0$. 

Moreover, if $0 \leq m \leq k$ then 

\[\lim_{r\to1} \left| \frac{u_n(r)}{(1-r)^m} \right| = \lim_{r\to1} \left| \frac{u_n(r)}{(1-r)^k} \right| (1-r)^{k-m} = 0.\] 

Finally, from (3.13) we have $\lim_{r\to1} u_n^{(m)}(r) = 0$. \[\square\]
Let $m_1, m_2 \in \mathbb{N}$, such that $m = m_1 + m_2$; then
\[
\left| \frac{\partial^m}{\partial \theta^m_1 \partial r^m_2} (u_n(r)e^{i\theta}) \right| = \left| n^{m_1} u_n^{(m_2)}(r) \right|.
\]

Therefore all derivatives of $u_n(r)e^{i\theta}$ are continuous, thus in order to prove that $u \in C^k(\mathbb{R}_3)$, it is sufficient to prove that, for each $0 \leq m \leq k$, the following series are uniformly convergent
\[
\sum_{n \neq 0} \frac{\partial^m}{\partial \theta^m_1 \partial r^m_2} (u_n(r)e^{i\theta}).
\]
(3.19)

When $n \neq 0$ and $0 \leq m \leq k$, it follows from lemmas 3.2 and 3.4 that
\[
\left| n^{m_1} u_n^{(m_2)}(r) \right| \leq c_m|n|^{m_1+m_2} \left[ \int_{1-\varepsilon}^{1+\varepsilon} |f_{n,k+1}(t)| \, dt + \sum_{j=0}^{m-1} \left| f_{n,k+1-j}(r) \right| \right]
\]
\[
\leq c_k \left[ (k+1)Q_{k+1,k+2} \right] = \frac{Q_k}{|n|^2},
\]
where $Q_k$ is a constant that depends only on $k$.

Since $\sum_{n \in \mathbb{Z}} Q_k/|n|^2$ converges, it follows from the Weierstrass M-test that (3.19) is uniformly convergent.

□

Remark 3.6. It is easy to see that the expression (1.4) is a necessary condition to the equation $T_\lambda u = f$ have solution, for all $\lambda \in \mathbb{C}$. Furthermore, differentiating both sides of the equation $T_\lambda u = f$ with respect to $r$ and using the $\theta$-Fourier coefficients we obtain the following equation
\[
-(j + \lambda n)u_n^{(j)}(1) = f_n^{(j)}(1), \quad \forall n \in \mathbb{Z} \text{ and } 1 \leq j \leq k.
\]
Therefore if $T_\lambda u = f$ has a $C^k$ solution and $\lambda = p/q > 0$ then $f_n^{(lq)}(1) = 0$, for all integer $l$ such that $0 \leq lp \leq k$. If $\lambda \notin \mathbb{Q}$ then we have only one condition, namely: $f_0(1) = 0$.

Remark 3.7. In order to construct a $C^k$ solution to the equation $T_\lambda u = f$, when $\lambda \in \mathbb{Q}^+$, we do not need to ask that $f$ be flat on $r = 1$.
In fact, we use only a finite number of compatibility conditions to obtain a $C^k$ solution and the following condition is sufficient to develop our proof:
If \( \lambda = p/q \in \mathbb{Q}^+ \) with \( \text{mdc}(p,q) = 1 \) and \( f^{(lp)}(1) = 0 \), for all nonnegative integers \( l \) such that \( lp \leq k \), then the equation \( T_\lambda u = f \) has a \( C^k \) solution in \( R_\delta \).

**Theorem 3.8.** Let \( f \in C^\infty(R_\delta) \) and \( k \in \mathbb{Z}^+ \). Then the equation \( T_\lambda u = f \) has a \( C^k \) solution \( u \) in \( R_\delta \) if and only if one of the following conditions is satisfied:

(i) If \( \lambda \in \mathbb{C} \setminus \mathbb{Q} \) and \( f_0(1) = 0 \);

(ii) If \( \lambda = p/q \in \mathbb{Q} \) with \( \text{mdc}(p,q) = 1 \) and \( f^{(lp)}(1) = 0 \), for all nonnegative integers \( l \) such that \( 0 \leq lp \leq k \).

**Remark 3.9.** If \( f \in C^\infty(R_\delta) \) and \( f_n \equiv 0 \), for all \( n < -k/\text{Re}\lambda \) (when \( \text{Re}\lambda > 0 \)) then we do not need to consider cases 1 and 2 in the proof of the proposition 2.2 and, in cases 3 and 4, we can take \( m > k \) and repeat all arguments, replacing \( k \) by \( m \), obtaining \( u \in C^\infty(R_\delta) \).

**Remark 3.10.** If \( f_n \equiv 0 \), for all \( n > -k/\text{Re}\lambda \) (when \( \text{Re}\lambda > 0 \)), then it is easy to see in the formulas (3.6) and (3.7) that \( \text{supp} u \subset R_\varepsilon \).
