Characterizations of linear Weingarten spacelike hypersurfaces in locally symmetric Lorentz spaces

Cícero P. Aquino    Henrique F. de Lima
Marco Antonio L. Velásquez

Abstract

We deal with complete linear Weingarten hypersurfaces immersed in a locally symmetric Lorentz space, whose sectional curvatures are supposed to obey some standard controls. In this setting, under suitable boundedness on the norm of the traceless part of the second fundamental form, we are able to show that such a hypersurface must be either totally umbilical or an isoparametric hypersurface with two distinct principal curvatures one of which is simple.

2000 AMS Subject Classification: Primary 53C42; Secondary 53A10, 53B30 and 53C50.

Key Words and Phrases: Locally symmetric Lorentz space; Einstein spacetimes; complete spacelike hypersurfaces; linear Weingarten hypersurfaces; totally umbilical hypersurfaces; isoparametric hypersurfaces

1 Introduction and statements of the main results

In 1970, Calabi [8] proved that the only complete maximal surfaces (that is, with zero mean curvature) in the 3-dimensional Lorentz-Minkowski space $\mathbb{L}^3$ are the spacelike planes. Equivalently, he showed that the only entire maximal graphs in $\mathbb{L}^3$ are the spacelike planes. This result has been the origin of a wide productive branch of research in differential geometry. Later, this result has been generalized to general dimension by Cheng and Yau [13] and, afterwards, also to complete spacelike hypersurfaces of constant mean curvature in $\mathbb{L}^{n+1}$ under some additional geometric assumptions (see, for instance, [1], [3], [21] and [23]).

Many authors have studied similar problems in other Lorentzian ambient spaces. As for the case of the de Sitter space $S_1^{n+1}$, which is the standard simply connected Lorentz space form of positive constant sectional curvature 1, Goddard [16] conjectured that every complete spacelike hypersurface with constant mean curvature $H$ in $S_1^{n+1}$ should be totally umbilical. Although the conjecture turned out to be false in its original statement, it motivated a great deal of work of several authors trying to find a positive answer to the conjecture under appropriate additional hypotheses. For instance, in [2] Akutagawa showed that Goddard’s conjecture is true when $0 \leq H^2 \leq 1$ in the case $n = 2$, and when $0 \leq H^2 < 4(n-1)/n^2$ in the case $n \geq 3$. Later on, Montiel [19] solved Goddard’s problem in the compact case proving that the only closed spacelike hypersurfaces in $S_1^{n+1}$ with constant mean curvature are the totally umbilical hypersurfaces.

Another Goddard-like problem is to characterize spacelike hypersurfaces immersed in a Lorentz space with constant scalar curvature. An interesting result due to Cheng and Ishikawa [12] states that the totally umbilical round spheres are the only compact spacelike hypersurfaces in $S_1^{n+1}$ with constant normalized scalar curvature $R < 1$. More recently, many other authors, such as Aledo and Alías [4], Brasil, Colares and Palmas [7], Camargo, Chaves and Sousa Jr. [9], Caminha [10], and Hu, Scherfner and
Zhai [17], have also worked on related problems.

It is natural to study the geometry of spacelike hypersurfaces immersed in more general Lorentz spaces, since they have important meaning in the relativity theory and are of substantial interest from geometric and mathematical cosmology points of view. In such direction, for constants $c_1$ and $c_2$, Choi et al. [15, 22] introduced the class of $(n + 1)$-dimensional Lorentz spaces $L^{n+1}_1$ which satisfy the following two conditions (here, $K$ denotes the sectional curvature of $L^{n+1}_1$):

$$K(u,v) = -\frac{c_1}{n},$$  \hspace{1cm} (1)

for any spacelike vector $u$ and timelike vector $v$; and

$$K(u,v) \geq c_2,$$  \hspace{1cm} (2)

for any spacelike vectors $u$ and $v$.

We observe that Lorentz space forms $L^{n+1}_1(c)$ satisfy conditions (1) and (2) for $-\frac{c_1}{n} = c_2 = c$. Moreover, there are several examples of Lorentz spaces which are not Lorentz space forms and satisfy (1) and (2). For instance, semi-Riemannian product manifolds $\mathbb{H}^k(-c_1/n) \times N^{n+1-k}(c_2)$, where $c_1 > 0$, and $\mathbb{R}_1^k \times S^{n+1-k}$. In particular, $\mathbb{R}_1^k \times S^n$ is a so-called Einstein Static Universe. Also the so-called Robertson-Walker spacetime $N(c,f) = I \times f N^3(c)$ is another general example of Lorentz space, where $I$ denotes an open interval of $\mathbb{R}_1^k$, $f$ is a positive smooth function defined on the interval $I$ and $N^3(c)$ is a 3-dimensional Riemannian manifold of constant curvature $c$. $N(c,f)$ also satisfies conditions (1) and (2) for an appropriate choice of the function $f$ (for more details, see [15] and [22]).

Here, our purpose is to study the geometry of complete linear Weingarten spacelike hypersurfaces, that is, complete spacelike hypersurfaces whose mean curvature $H$ and normalized scalar curvature $R$ satisfy

$$R = aH + b,$$

for some $a, b \in \mathbb{R}$. In this setting, by exploring the ellipticity of a suitable Cheng-Yau modified operator (see Section 3), we are able to establish
characterization theorems concerning to such spacelike hypersurfaces immersed in a locally symmetric Lorentz space $L_1^{n+1}$, which is supposed to obey conditions (1) and (2). We recall that a Lorentz space $L_1^{n+1}$ is said \textit{locally symmetric} if all the covariant derivative components $\overline{R}_{ABCD;E}$ of the curvature tensor of $L_1^{n+1}$ vanish identically.

In order to state our result, we will need some basic facts. Denoting by $\overline{R}_{AB}$ the components of the Ricci tensor of $L_1^{n+1}$ satisfying condition (1), the scalar curvature $\overline{R}$ of $L_1^{n+1}$ is given by

$$\overline{R} = \sum_{A=1}^{n+1} \varepsilon_A \overline{R}_{AA} = \sum_{i,j=1}^{n} \overline{R}_{ijji} - 2 \sum_{i=1}^{n} \overline{R}_{(n+1)ii(n+1)} = \sum_{i,j=1}^{n} \overline{R}_{ijji} + 2c_1.$$

Moreover, it is well known that the scalar curvature of a locally symmetric Lorentz space is constant. Consequently, $\sum_{i,j} \overline{R}_{ijji}$ is a constant naturally attached to a locally symmetric Lorentz space satisfying condition (1).

Now, we are in position to present our results. In what follows, for the sake of simplicity of notation, $\overline{R} = \frac{1}{n(n-1)} \sum_{i,j} \overline{R}_{ijji}$ and $\Phi$ stands for the traceless part of the second fundamental form of the spacelike hypersurface $M^n$.

**Theorem 1.1.** Let $L_1^{n+1}$ be a locally symmetric Lorentz space satisfying conditions (1) and (2), with $n \geq 3$ and $c = \frac{c_1}{n} + 2c_2 > 0$. Let $M^n$ be a complete linear Weingarten spacelike hypersurface immersed in $L_1^{n+1}$, such that $R = aH + b$ with $b < \overline{R}$. Suppose that $\overline{R} - c < R < \overline{R} - \frac{2c}{n}$. If $H$ can attain the maximum on $M^n$ and

$$\sup_M |\Phi|^2 \leq \frac{(n-1)(\overline{R} - c)^2}{(n-2)(\overline{R} - \frac{2c}{n})},$$

then either

i. $|\Phi| \equiv 0$ and $M^n$ is totally umbilical;

ii. or $|\Phi|^2 \equiv \frac{(n-1)(\overline{R} - c)^2}{(n-2)(\overline{R} - \frac{2c}{n})}$ and $M^n$ is an isoparametric hypersurface with two distinct principal curvatures one of which is simple.
Characterizations of linear Weingarten hypersurfaces

Related to the compact case, when the ambient space is a locally symmetric Einstein spacetime, we obtain the following:

**Theorem 1.2.** Let $L^{n+1}_1$ be a locally symmetric Einstein spacetime satisfying conditions (1) and (2), with $n \geq 3$ and $c = \frac{c_1}{n} + 2c_2 > 0$. Let $M^n$ be a compact linear Weingarten spacelike hypersurface immersed in $L^{n+1}_1$, such that $R = aH + b$ with $(n-1)a^2 + 4n(\overline{R} - b) \geq 0$ and $b \neq \overline{R}$. Suppose that $\overline{R} - c < R < \overline{R} - \frac{2c}{n}$. If

$$\sup_M |\Phi|^2 < \frac{(n-1)(\overline{R} - R - c)^2}{(n-2)(\overline{R} - R - \frac{2c}{n})},$$

then $|\Phi| \equiv 0$ and $M^n$ is totally umbilical.

Proceeding, we also get the following:

**Theorem 1.3.** Let $L^{n+1}_1$ be a locally symmetric Lorentz space satisfying conditions (1) and (2), with $n \geq 3$ and $c = \frac{c_1}{n} + 2c_2$. Let $M^n$ be a complete linear Weingarten spacelike hypersurface immersed in $L^{n+1}_1$, such that $R = aH + b$ with $b < \overline{R}$. Suppose that either $R < \overline{R} - c$, if $c > 0$, or $R < \overline{R} - \frac{2c}{n}$, if $c \leq 0$. If $H$ can attain the maximum on $M^n$ and

$$\inf_M |\Phi|^2 \geq \frac{(n-1)(\overline{R} - R - c)^2}{(n-2)(\overline{R} - R - \frac{2c}{n})},$$

then $|\Phi|^2 = \frac{(n-1)(\overline{R} - R - c)^2}{(n-2)(\overline{R} - R - \frac{2c}{n})}$ and $M^n$ is an isoparametric hypersurface with two distinct principal curvatures one of which is simple.

The proofs of Theorems 1.1, 1.2 and 1.3 are given in Section 4.

### 2 Preliminaries

We recall that an $(n+1)$-dimensional Lorentz space $L^{n+1}_1$ is a semi-Riemannian manifold of index 1 and that a hypersurface $M^n$ immersed in
22. Aquino, H.F. de Lima and M.A.L. Velásquez

$L^{n+1}_1$ is said to be *spacelike* if the metric on $M^n$ induced from that of the ambient space $L^{n+1}_1$ is positive definite. In this setting, we choose a local field of semi-Riemannian orthonormal frame $\{e_A\}_{1 \leq A \leq n+1}$ in $L^{n+1}_1$, with dual coframe $\{\omega_A\}_{1 \leq A \leq n+1}$, such that, at each point of $M^n$, $e_1, \ldots, e_n$ are tangent to $M^n$ and $e_{n+1}$ is normal to $M^n$. We will use the following convention for the indices:

$$1 \leq A, B, C, \ldots \leq n + 1, \ 1 \leq i, j, k, \ldots \leq n.$$  

Denoting by $\{\omega_{AB}\}$ the connection forms of $L^{n+1}_1$, we have that the structure equations of $L^{n+1}_1$ are given by:

$$d\omega_A = - \sum_B \varepsilon_B \omega_{AB} \wedge \omega_B, \quad \omega_{AB} + \omega_{BA} = 0, \quad \varepsilon_i = 1, \varepsilon_{n+1} = -1, \quad (6)$$

$$d\omega_{AB} = - \sum_C \varepsilon_C \omega_{AC} \wedge \omega_{CB} - \frac{1}{2} \sum_{C,D} \varepsilon_C \varepsilon_D R_{ABCD} \omega_C \wedge \omega_D. \quad (7)$$

Here, $R_{ABCD}$, $R_{CD}$ and $R$ denote respectively the semi-Riemannian curvature tensor, the Ricci tensor and the scalar curvature of the Lorentz space $L^{n+1}_1$. In this setting, we have

$$R_{CD} = \sum_B \varepsilon_B R_{BDCB}, \quad R = \sum_A \varepsilon_A R_{AA}. \quad (8)$$

Moreover, the components $R_{ABCD;E}$ of the covariant derivative of the semi-Riemannian curvature tensor of $L^{n+1}_1$ are defined by

$$\sum_E \varepsilon_E R_{ABCD;E} \omega_E = dR_{ABCD} - \sum_E \varepsilon_E (R_{EBCD} \omega_{EA} + R_{AECD} \omega_{EB} + R_{ABED} \omega_{EC} + R_{ABCE} \omega_{ED}).$$

Next, we restrict all the tensors to the spacelike hypersurface $M^n$ in $L^{n+1}_1$. First of all, $\omega_{n+1} = 0$ on $M^n$, so $\sum_i \omega_{(n+1)i} \wedge \omega_i = d\omega_{n+1} = 0$. Consequently, by *Cartan’s Lemma* [11], there are $h_{ij}$ such that

$$\omega_{(n+1)i} = \sum_j h_{ij} \omega_j \quad \text{and} \quad h_{ij} = h_{ji}. \quad (8)$$
Characterizations of linear Weingarten hypersurfaces

This gives the second fundamental form of $M^n$, $h = \sum_{i,j} h_{ij} \omega_i \omega_j e_{n+1}$, and its square length $S = \sum_{i,j} h_{ij}^2$. Furthermore, the mean curvature $H$ of $M^n$ is defined by $H = \frac{1}{n} \sum_i h_{ii}$.

The connection forms $\{\omega_{ij}\}$ of $M^n$ are characterized by the structure equations of $M^n$:

\[ d\omega_i = - \sum_j \omega_{ij} \wedge \omega_j, \quad \omega_{ij} + \omega_{ji} = 0, \quad (9) \]
\[ d\omega_{ij} = - \sum_k \omega_{ik} \wedge \omega_{kj} - \frac{1}{2} \sum_{k,l} R_{ijkl} \omega_k \wedge \omega_l, \quad (10) \]

where $R_{ijkl}$ are the components of the curvature tensor of $M^n$.

Using the structure equations we obtain the Gauss equation

\[ R_{ijkl} = R_{i \overline{k} j \overline{l}} - (h_{ik} h_{jl} - h_{il} h_{jk}). \quad (11) \]

The components $R_{ij}$ of the Ricci tensor and the scalar curvature $R$ of $M^n$ are given, respectively, by

\[ R_{ij} = \sum_k R_{kij} - nHh_{ij} + \sum_k h_{ik}h_{kj}, \quad (12) \]

and

\[ n(n-1)R = \sum_{j,k} R_{kjj} - n^2 H^2 + S. \quad (13) \]

The first covariant derivatives $h_{ijk}$ of $h_{ij}$ satisfy

\[ \sum_k h_{ijk} \omega_k = dh_{ij} - \sum_k h_{ik} \omega_{kj} - \sum_k h_{jk} \omega_{ki}. \quad (14) \]

Then, by exterior differentiation of (8), we obtain the Codazzi equation

\[ h_{ijk} - h_{ikj} = R_{(i+1)jk}. \quad (15) \]

Similarly, the second covariant derivatives $h_{ijkl}$ of $h_{ij}$ are given by

\[ \sum_l h_{ijkl} \omega_l = dh_{ijk} - \sum_l h_{i lj} \omega_l - \sum_l h_{ikl} \omega_{lj} - \sum_l h_{ijl} \omega_{lk}. \quad (16) \]
By exterior differentiation of (14), we can get the following Ricci formula
\[ h_{ijkl} - h_{ijlk} = \sum_m h_{im} R_{mjkl} - \sum_m h_{jm} R_{mikl}. \] (17)

Restricting the covariant derivative $\bar{R}_{ABCD,E}$ of $\bar{R}_{ABCD}$ on $M^n$, then $\bar{R}_{(n+1)ijkl}$ is given by
\[ \bar{R}_{(n+1)ijkl} = \bar{R}_{(n+1)ijkl} + \bar{R}_{(n+1)ij(n+1)k} h_{jl} + \sum_m \bar{R}_{mijk} h_{ml}, \] (18)

where $\bar{R}_{(n+1)ijkl}$ denotes the covariant derivative of $\bar{R}_{(n+1)ijk}$ as a tensor on $M^n$ so that
\[
\sum_l \bar{R}_{(n+1)ijkl} \omega^l = d \bar{R}_{(n+1)ijk} - \sum_l \bar{R}_{(n+1)ijkl} \omega^l,
\]

\[- \sum_l \bar{R}_{(n+1)ijl} \omega^l - \sum_l \bar{R}_{(n+1)ijl} \omega^l. \]

The Laplacian $\Delta h_{ij}$ of $h_{ij}$ is defined by $\Delta h_{ij} = \sum_k h_{ijk}$. From (15), (17) and (18), after a straightforward computation we obtain
\[
\Delta h_{ij} = (nH)_{ij} - nH \sum_l h_{il} h_{ij} + Sh_{ij} \]
\[ + \sum_k (\bar{R}_{(n+1)ijk} + \bar{R}_{(n+1)kik,j}) \]
\[ - \sum_k (h_{kk} \bar{R}_{(n+1)ij(n+1)} + h_{ij} \bar{R}_{(n+1)k(n+1)k}) \]
\[ - \sum_{k,l} (2 h_{kl} \bar{R}_{lkj} + h_{jl} \bar{R}_{lkk} + h_{il} \bar{R}_{lkj}). \]

Since $\Delta S = 2 \left( \sum_{i,j,k} h_{ijk}^2 + \sum_{i,j} h_{ij} \Delta h_{ij} \right)$, from (19) we get
Characterizations of linear Weingarten hypersurfaces

\[
\frac{1}{2} \Delta S = S^2 + \sum_{i,j,k} h^2_{i,j} + \sum_{i,j} (nH)_{ij}h_{ij} \\
+ \sum_{i,j,k} (\overline{R}_{(n+1)ijk;k} + \overline{R}_{(n+1)kki;j})h_{ij} \\
- \left( \sum_{i,j} nHh_{ij}\overline{R}_{(n+1)ij(n+1)} + S \sum_{k} \overline{R}_{(n+1)k(n+1)k} \right) \\
- 2 \sum_{i,j,k,l} (h_{kl}h_{ij}\overline{R}_{lijk} + h_{il}h_{ij}\overline{R}_{lkjk}) - nH \sum_{i,j,l} h_{il}h_{ij}h_{ij}.
\]

\[(20)\]

Now, let \( \phi = \sum_{i,j} \phi_{ij}\omega_i \otimes \omega_j \) be a symmetric tensor on \( M^n \) defined by

\[
\phi_{ij} = nH\delta_{ij} - h_{ij}.
\]

Following Cheng-Yau [14], we introduce an operator \( \Box \) associated to \( \phi \) acting on any smooth function \( f \) by

\[
\Box f = \sum_{i,j} \phi_{ij}f_{ij} = \sum_{i,j} (nH\delta_{ij} - h_{ij})f_{ij}.
\]

\[(21)\]

Setting \( f = nH \) in (21) and taking a (local) orthonormal frame \( \{e_1, \ldots, e_n\} \) on \( M^n \) such that \( h_{ij} = \lambda_i\delta_{ij} \), from equation (13) we obtain the following

\[
\Box (nH) = \frac{1}{2} \Delta (nH)^2 - \sum_i (nH)_{i}^2 - \sum_i \lambda_i (nH)_{ii} \\
= \frac{1}{2} \Delta S - n^2 |\nabla H|^2 - \sum_i \lambda_i (nH)_{ii} \\
+ \frac{1}{2} \Delta \left( \sum_{i,j} \overline{R}_{ijji} - n(n-1)R \right).
\]

\[(22)\]

3 Some auxiliary results

In order to prove our results, we will need some auxiliary lemmas. The first one is a classic algebraic lemma due to M. Okumura in [20], and
completed with the equality case proved in [5] by H. Alencar and M. do Carmo.

Lemma 3.1. Let $\mu_1, \ldots, \mu_n$ be real numbers such that $\sum_i \mu_i = 0$ and $\sum_i \mu_i^2 = \beta^2$, with $\beta \geq 0$. Then,

$$-\frac{(n-2)}{\sqrt{n(n-1)}} \beta^3 \leq \sum_i \mu_i^3 \leq \frac{(n-2)}{\sqrt{n(n-1)}} \beta^3,$$

and equality holds if, and only if, at least $(n-1)$ of the numbers $\mu_i$ are equal.

Now, we present our second auxiliary lemma. Following the steps of the proof of Lemma 2.1 of [18], we get

Lemma 3.2. Let $M^n$ be a linear Weingarten spacelike hypersurface immersed in a locally symmetric Lorentz space $L_1^{n+1}$ satisfying condition (1), such that $R = aH + b$ with $b \neq \overline{R}$. Suppose that

$$(n-1)a^2 + 4n (\overline{R} - b) \geq 0. \quad (24)$$

Then,

$$\sum_{i,j,k} h_{ijk}^2 \geq n^2 |\nabla H|^2. \quad (25)$$

Moreover, if the inequality (24) is strict and the equality holds in (25) on $M^n$, then $H$ is constant on $M^n$.

Proof. Since we are supposing that $R = aH + b$ and the term $\overline{R}$ is constant, from equation (13) we get

$$2 \sum_{i,j} h_{ij}h_{ijk} = (2n^2H + n(n-1)a)(H)_k.$$

Thus,

$$4 \sum_k \left( \sum_{i,j} h_{ij}h_{ijk} \right)^2 = (2n^2H + n(n-1)a)^2 |\nabla H|^2.$$
Characterizations of linear Weingarten hypersurfaces

Consequently, using Cauchy-Schwartz inequality, we obtain that

\[ 4S \sum_{i,j,k} h_{ijk}^2 = 4 \left( \sum_{i,j} h_{ij}^2 \right) \left( \sum_{i,j,k} h_{ijk}^2 \right) \geq \left( \sum_{i,j} h_{ij} h_{ijk} \right)^2 = \left( 2n^2 H + n(n-1)a \right)^2 |\nabla H|^2. \]

On the other hand, since \( R = aH + b \), using again equation (13) we easily verify that

\[ \left( 2n^2 H + n(n-1)a \right)^2 = 4n^3(n-1)R - 4n^3(n-1)b + n^2(n-1)^2 a^2 + 4n^2 S. \]

Consequently, from (24), (26) and (27), we get

\[ S \sum_{i,j,k} h_{ijk}^2 \geq n^2 S |\nabla H|^2. \]

Therefore, we obtain either \( S = 0 \) and \( \sum_{i,j,k} h_{ijk}^2 = n^2 |\nabla H|^2 \) or \( \sum_{i,j,k} h_{ijk}^2 \geq n^2 |\nabla H|^2 \). Moreover, if the inequality (24) is strict, from (27) we get that

\[ \left( 2n^2 H + n(n-1)a \right)^2 > 4n^2 S. \]

Consequently, if \( \sum_{i,j,k} h_{ijk}^2 = n^2 |\nabla H|^2 \) holds on \( M^n \), from (26) we conclude that \( \nabla H = 0 \) on \( M^n \) and, hence, \( H \) is constant on \( M^n \). \( \Box \)

Now, we consider the Cheng-Yau’s modified operator

\[ L = \Box + \frac{n-1}{n} a \Delta. \]  

Related to such operator, we have the following sufficient criterion of ellipticity.

**Lemma 3.3.** Let \( M^n \) be a linear Weingarten spacelike hypersurface immersed in a locally symmetric Lorentz space \( L^{n+1}_1 \) satisfying condition (1), such that \( R = aH + b \) with \( b < \bar{R} \). Then, \( H \) does not vanish on \( M^n \) and \( L \) is elliptic.
Proof. From equation (13), since \( R = aH + b \) with \( b < \overline{R} \), we easily see that \( H \) cannot vanish on \( M^n \) and, by choosing the appropriate Gauss mapping, we may assume that \( H > 0 \) on \( M^n \).

Let us consider the case that \( a = 0 \). Since \( R = b < \overline{R} \), from equation (13) if we choose a (local) orthonormal frame \( \{e_1, \ldots, e_n\} \) on \( M^n \) such that \( h_{ij} = \lambda_i \delta_{ij} \), we have that \( \sum_{i<j} \lambda_i \lambda_j > 0 \). Consequently,

\[
n^2H^2 = \sum_i \lambda_i^2 + 2 \sum_{i<j} \lambda_i \lambda_j > \lambda_i^2
\]

for every \( i = 1, \ldots, n \) and, hence, we have that \( nH - \lambda_i > 0 \) for every \( i \). Therefore, in this case, we conclude that \( L \) is elliptic.

Now, suppose that \( a \neq 0 \). From equation (13) we get that

\[
a = \frac{1}{n(n-1)H} \left( S - n^2H^2 + n(n-1)(\overline{R} - b) \right).
\]

Consequently, for every \( i = 1, \ldots, n \), with a straightforward algebraic computation we verify that

\[
nH - \lambda_i + \frac{n-1}{2}a = nH - \lambda_i + \frac{1}{2nH} \left( S - n^2H^2 + n(n-1)(\overline{R} - b) \right)
\]

\[
= \frac{1}{2nH} \left( \sum_{j \neq i} \lambda_j^2 + (\sum_{j \neq i} \lambda_j)^2 + n(n-1)(\overline{R} - b) \right).
\]

Therefore, since \( b < \overline{R} \), we also conclude in this case that \( L \) is elliptic. \( \blacksquare \)

4 Proofs of Theorems 1.1, 1.2 and 1.3

In what follows, we present some computations which are common for the proofs of Theorems 1.1, 1.2 and 1.3. At this point, we assume that \( M^n \) is a complete linear Weingarten spacelike hypersurface immersed in a locally symmetric Lorentzian space \( L_1^{n+1} \), \( n \geq 3 \), satisfying conditions (1) and (2), such that \( R = aH + b \) with \( (n-1)a^2 + 4n(\overline{R} - b) \geq 0 \).

Initially, we observe that the local symmetry of \( L_1^{n+1} \) implies that

\[
\sum_{i,j,k} (\overline{R}_{(n+1)ij;k} + \overline{R}_{(n+1)kik;j})h_{ij} = 0.
\]
Characterizations of linear Weingarten hypersurfaces

Consequently, if we choose a (local) orthonormal frame \( \{ e_i \}_{1 \leq i \leq n} \) on \( M^n \) such that \( h_{ij} = \lambda_i \delta_{ij} \), taking into account equations (20) and (22), we get from (28) that

\[
L(nH) = \sum_{i,j,k} h_{ijk}^2 - n^2|\nabla H|^2 + S^2 - nH \sum_i \lambda_i^3
\]
\[ - 2 \sum_{i,k} (\lambda_i \lambda_k R_{kiik} + \lambda_i^2 T_{ikik}) \]
\[ - \left( \sum_i nH \lambda_i R_{(n+1)ii(n+1)} + S \sum_k R_{(n+1)k(n+1)k} \right). \quad (29)
\]

Thus, from Lemma 3.2 we have

\[
L(nH) \geq S^2 - nH \sum_i \lambda_i^3 - 2 \sum_{i,k} (\lambda_i \lambda_k R_{kiik} + \lambda_i^2 T_{ikik})
\]
\[ - \left( \sum_i nH \lambda_i R_{(n+1)ii(n+1)} + S \sum_k R_{(n+1)k(n+1)k} \right). \quad (30)
\]

Now, set \( \Phi_{ij} = h_{ij} - H \delta_{ij} \). We will consider the following symmetric tensor

\[
\Phi = \sum_{i,j} \Phi_{ij} \omega_i \otimes \omega_j. \quad (31)
\]

It is easy to check that \( \Phi \) is traceless and, for this reason, it is called traceless part of the second fundamental form of \( M^n \). Moreover, if \( |\Phi|^2 = \sum_{i,j} \Phi_{ij}^2 \) is the square of the length of \( \Phi \), then

\[
|\Phi|^2 = S - nH^2. \quad (32)
\]

If we take a (local) frame field \( \{ e_i \}_{1 \leq i \leq n} \) at \( p \in M^n \), such that

\[
h_{ij} = \lambda_i \delta_{ij} \quad \text{and} \quad \Phi_{ij} = \mu_i \delta_{ij},
\]

it is straightforward to check the following algebraic relations:

\[
\begin{align*}
\sum_i \mu_i &= 0, \\
\sum_i \mu_i^2 &= |\Phi|^2, \\
\sum_i \mu_i^3 &= \sum_i \lambda_i^3 - 3H|\Phi|^2 - nH^3.
\end{align*}
\]
Consequently, by applying Lemma 3.1 to the real numbers $\mu_1, \ldots, \mu_n$, we get

\[
S^2 - nH \sum_i \lambda_i^3 = (|\Phi|^2 + nH^2)^2 - n^2H^4 - 3nH^2|\Phi|^2 - nH \sum_i \mu_i^3 \geq |\Phi|^4 - nH^2|\Phi|^2 - \frac{n(n-2)}{\sqrt{n(n-1)}} H|\Phi|^3.
\]

Using curvature conditions (1) and (2), we get

\[
- \left( \sum_{i,j} nH \lambda_i \overline{R}_{i(i+1)(j+1)} + S \sum_k \overline{R}_{(i+1)(j+1)k} \right) = c_1(S - nH^2) \quad (34)
\]

and

\[
-2 \sum_{i,j,k,l} (\lambda_i \lambda_k \overline{R}_{kik} + \lambda_i^2 \overline{R}_{ikik}) \geq c_2 \sum_{i,k} (\lambda_i - \lambda_k)^2 = 2nc_2(S - nH^2). \quad (35)
\]

Hence, setting $c = \frac{c_1}{2} + 2c_2$, from (30), (32), (33), (34) and (35) we obtain that

\[
L(nH) \geq |\Phi|^2 \left( \frac{nc + S - 2nH^2}{\sqrt{n(n-1)}} \frac{n(n-2)}{\sqrt{n(n-1)}} H|\Phi| \right) \quad (36)
\]

\[
= |\Phi|^2 \left( \frac{nc + |\Phi|^2 - nH^2}{\sqrt{n(n-1)}} \frac{n(n-2)}{\sqrt{n(n-1)}} H|\Phi| \right).
\]

On the other hand, from (13) and (32) we have

\[
H^2 = \frac{1}{n(n-1)} |\Phi|^2 + \overline{R} - R, \quad (37)
\]

and, since we can assume that $H > 0$ on $M^n$,

\[
H = \frac{1}{\sqrt{n(n-1)}} \sqrt{|\Phi|^2 + n(n-1)(\overline{R} - R)}. \quad (38)
\]
Characterizations of linear Weingarten hypersurfaces

Substituting (37) and (38) into (36), we finally get

$$L(nH) \geq \frac{1}{n-1}|\Phi|^2 P_R(|\Phi|),$$

(39)

where

$$P_R(x) = (n-2)x^2 - (n-2)x\sqrt{x^2 + n(n-1)(\bar{R} - R)} + n(n-1)(c + R - \bar{R}).$$

(40)

We observed that $P_R(x) = 0$ if, and only if,

$$x^2 = \frac{(n(n-1)(c + R - \bar{R}))^2}{n(n-2)(n(n-1)(\bar{R} - R - \frac{2c}{n}))}. \tag{41}$$

At this point, we proceed with the proofs of Theorems 1.1, 1.2 and 1.3.

**Proof of Theorem 1.1.**

Since we are supposing that $c > 0$ and $\bar{R} - c < R < \bar{R} - \frac{2c}{n}$, from (40) and (41) we easily verify that $P_R(0) = n(n-1)(c + R - \bar{R}) > 0$ and the function $P_R(x)$ is strictly decreasing for $x \geq 0$, with $P_R(\bar{x}) = 0$ at

$$\bar{x} = \frac{n(n-1)(c + R - \bar{R})}{\sqrt{n(n-2)\sqrt{n(n-1)(\bar{R} - R - \frac{2c}{n})}}} > 0.$$

Thus, hypothesis (3) ensures that $0 \leq |\Phi| \leq \bar{x}$ and $P_R(|\Phi|) \geq 0$. Hence, from (39) we have

$$L(nH) \geq \frac{1}{n-1}|\Phi|^2 P_R(|\Phi|) \geq 0. \tag{42}$$

Since we are supposing $b < \bar{R}$, Lemma 3.3 guarantees that $L$ is elliptic. Consequently, since we are also assuming that $H$ attains its maximum on $M^n$, from (42) we can apply Hopf’s strong maximum principle in order to conclude that $H$ is constant on $M^n$. Hence, taking into account equation (29), we get

$$\sum_{i,j,k} h_{ij,k}^2 = n^2|\nabla H|^2 = 0,$$
and it follows that $\lambda_i$ is constant for every $i \in \{1, \ldots, n\}$.

If $|\Phi| < \tilde{x}$, then from (42) we have that $|\Phi| = 0$ and, hence, $M^n$ is totally umbilical. If $|\Phi| = \tilde{x}$, since the equality holds in (23) of Lemma 3.1, we conclude that $M^n$ is either totally umbilical or an isoparametric spacelike hypersurface with two distinct principal curvatures one of which is simple.

**Proof of Theorem 1.2.**

From (21) we have that

$$\Box f = \text{trace}(P_1 \circ \nabla^2 f),$$

where, denoting by $I$ the identity in the algebra of smooth vector fields on $M^n$, $P_1 = nHI - h$ and $\nabla^2 f$ stands for the self-adjoint linear operator metrically equivalent to the hessian of $f$. Thus, by using the standard notation $\langle \cdot, \cdot \rangle$ for the (induced) metric of $M^n$, we get

$$\Box f = \sum_i \langle P_1(\nabla e_i \nabla f), e_i \rangle,$$

where $\{e_1, \ldots, e_n\}$ is a local orthonormal frame on $M^n$. Consequently, we have that

$$\text{div}(P_1(\nabla f)) = \sum_i \langle (\nabla e_i P_1)(\nabla f), e_i \rangle + \sum_i \langle P_1(\nabla e_i \nabla f), e_i \rangle$$

$$= \delta \text{div}(P_1 \nabla f) + \Box f,$$

(43)

where

$$\text{div} P_1 := \text{trace}(\nabla P_1) = \sum_i \langle \nabla e_i P_1(e_i) \rangle.$$

On the other hand, since we are assuming that $L_1^{n+1}$ is an Einstein space-time, there exist a constant $\lambda$ such that $\overline{\text{Ric}} = \lambda \langle \cdot, \cdot \rangle$, where $\overline{\text{Ric}}$ denotes the Ricci tensor of $L_1^{n+1}$. Thus, denoting by $\overline{R}$ the curvature tensor of $L_1^{n+1}$, from Lemma 3.1 of [6] we have

$$\langle \text{div} P_1, \nabla f \rangle = \sum_i \langle \overline{R}(N, e_i) e_i, \nabla f \rangle = -\overline{\text{Ric}}(N, \nabla f) = -\lambda \langle N, \nabla f \rangle = 0.$$
where $N$ stands for the Gauss mapping of $M^n$. Hence, from (43), we conclude that

$$\Box f = \text{div}(P_1(\nabla f)).$$  (44)

Consequently, from (28) and (44), we have that

$$L(nH) = \text{div}(P(\nabla H)), $$  (45)

where $P = nP_1 + \frac{n(n-1)}{2}aI$.

Now, by applying the divergence theorem, from (42) we get

$$0 = \int_M L(nH) \geq \int_M \left\{ -\frac{1}{n-1} |\Phi|^2 P_R(|\Phi|) \right\} dM \geq 0.$$  (46)

Consequently, taking into account hypothesis (4), from (46) we conclude that $|\Phi| = 0$ on $M^n$ and, hence, $M^n$ is totally umbilical.

**Proof of Theorem 1.3.**

First, from our restrictions on $R$, we note that

(a) $R < \overline{R} - c < \overline{R} - \frac{2c}{n}$, when $c > 0$;

(b) $R < \overline{R} - \frac{2c}{n} \leq \overline{R} - c$, when $c \leq 0$.

In both of these cases, from (40) and (41) we have that

$$P_R(0) = -n(n-1)(\overline{R} - R - c) < 0$$

and the function $P_R(x)$ is strictly increasing for $x \geq 0$, with $P_R(\hat{x}) = 0$ at

$$\hat{x} = \frac{n(n-1)(\overline{R} - R - c)}{\sqrt{n(n-2)}\sqrt{n(n-1)(\overline{R} - R - \frac{2c}{n})}} > 0. $$

Thus, hypothesis (5) guarantees that $|\Phi| \geq \hat{x} > 0$ and $P_R(|\Phi|) \geq 0$. Hence, from (39) we have

$$L(H) \geq \frac{1}{n-1} |\Phi|^2 P_R(|\Phi|) \geq 0.$$  (47)

In a similar way of the proof of Theorem 1.1, since we are supposing that $b < \overline{R}$, we can apply Hopf’s strong maximum principle to guarantee that
\( H \) is constant on \( M^n \) and that \( \lambda_i \) is constant for every \( i \in \{1, \ldots, n\} \). Since \( |\Phi| > 0 \), from (47) we obtain that \( L(H) \geq 0 \) if, and only if, \( |\Phi| = \hat{x} \). Hence, Lemma 3.1 assures that \( M^n \) is an isoparametric spacelike hypersurface with two distinct principal curvatures one of which is simple.
